Abstract: MoV92 Ori = UCAC3 193-019323 Ori was discovered by Wolfgang Moschner in the year 2016 and classified as EW eclipsing binary. The authors present a phased light curve, a list of primary and secondary minima, O-C diagrams and an improved period solution of the star. The variable is known at ASAS-SN and ATLAS.

Introduction
MoV92 Ori = UCAC3 193-019323 Ori was discovered as a photometric variable by Wolfgang Moschner in the year 2016 and classified as eclipsing binary. The amplitude is given as 0.6 mag, 15.8-16.4 mag (V). The variable is listed in the ATLAS [1] and ASAS-SN-Variable Star Database [2].

During these studies, we furthermore discovered several period solutions for this star in an extensive datasheet prepared by the ATLAS project [1]. One of these periods (ATLAS) is similar to ours. We have at our disposal 13 time series with approx. 1980 images that were taken between 2016 and 2020. The observation time per night was between 4 and 8 hours.

Since the minima derived from our data cannot be represented by the ASAS-SN and ATLAS periods, we have used our data to present an improved period solution.

Periods known so far:

Simbad  no information
ASAS-SN  0.3011746 d
ATLAS  0.3011760 d
VSX [3]  no information
ZTF [4]  no information
Observations
400mm ASA Astrograph f/3.7
f = 1471 mm
FLI Proline 16803 CCD-Camera
V-filter, t = 120 sec.
Wolfgang Moschner, Astrocamp/Nerpio, Spain

Data analysis
Muniwin [5] and self-written programs by Franz Agerer and Lienhard Pagel [6] were used for the analysis of the frames, after bias, dark and flatfield correction of the exposures. The weighted average of five comparison stars was used.

Explanations:
HJD = heliocentric UTC timings (JD) of the observed minima
mag = (raw instrumental) magnitude

G-band mean magnitude = 350-1000 nm
Integrated BP mean magnitude = 330-680 nm
Integrated RP mean magnitude = 640-1000 nm

Explanations to the light curve:
Different colors denote different observing nights.

All coordinates are taken from the Gaia DR2 catalogue [7].

The coordinates (epoch J2000) are computed by VizieR, and are not part of the original data from Gaia (note that the computed coordinates are computed from the positions and the proper motions).

16.2267 mag  Integrated BP mean magnitude
15.1834 mag  Integrated RP mean magnitude
1.0433 mag  BP-RP color
Results

With our observations obtained with the 400 mm ASA astrograph in Nerpio we have created a phased light curve. The presented elements were calculated by the method of least squares, taking into account all our minima (see table below) and assuming that the true phase of Min II is exactly 0.5.

Our ephemeris represents a significant improvement over the ASAS-SN period and all ATLAS periods, since our minima are not represented with all periods known so far.

The amplitude for Min I is given as 0.6 mag, 15.8-16.4 mag (V) and for Min II as 0.5 mag, 15.8-16.3 mag (V).

MoV92 Ori = UCAC3 193-019323 Ori (improved elements)

Amplitude: Min I: 0.6 mag (instr.) Min II: 0.5 mag (instr.)
Type: EW type eclipsing binary

Min I = HJD (UTC) 2457752.3624 + 0.3011722*E
     +0.0010 +0.0000003

Figure 1: Phased light curve of MoV92 Ori = UCAC3 193-019323 Ori using the ephemeris given by the authors. The vertical axis shows raw instrumental magnitudes. Different colors denote different observing nights. Only the data points from the better nights were used to display the light curve. An FLI Proline 16803 camera + a V-filter (2019-2020) was used.
